

Machine Learning

Andrew Ng
Edited Bart Vanrumste

#### Supervised Learning

Given the "right answer" for each example in the data.

#### Regression Problem

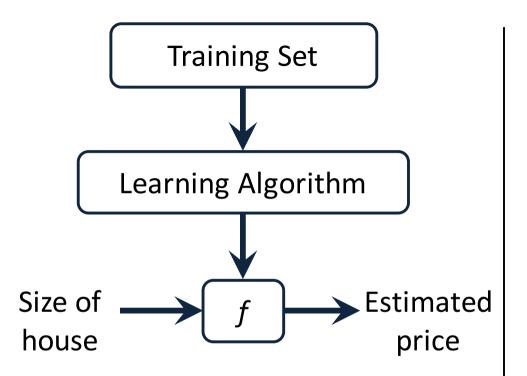

Predict real-valued output

Training set of housing prices (Portland, OR)

Size in feet <sup>2</sup> (x)		Price (\$) in 1000's (y)
(1)	2104	460
(2)	1416	232
13	1534	315
14	852	178
;	•••	•••

#### **Notation:**

```
m = Number of training examples
x's = "input" variable / features
y's = "output" variable / "target" variable
```

#### How do we represent h?

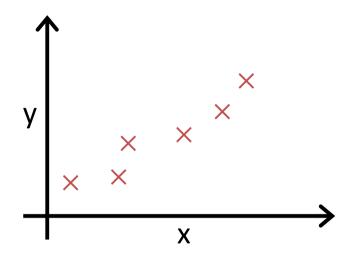

Linear regression with one variable. Univariate linear regression.

### Cost function

**Training Set** 

_	Size in feet <sup>2</sup> (x)	Price (\$) in 1000's (y)
	2104	460
	1416	232
	1534	315
	852	178
	•••	•••

How to choose the parameters

Idea: Choose w and b so that f is close to y for our training examples (x, y)

Cost function intuition

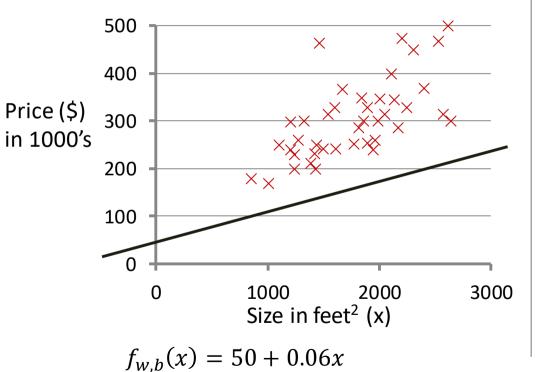

Model: 
$$f_{w,b}(x) = wx + b$$

Cost Function: 
$$J(w,b) = \frac{1}{2m} \sum_{i=1}^{m} (f_{w,b}(x^{(i)}) - y^{(i)})^2$$

Objective: 
$$\min_{w,b} \text{minimize } J(w,b)$$

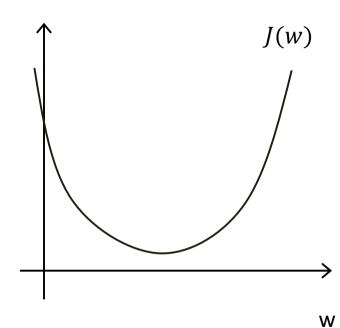

(function of x (when w and b fixed))

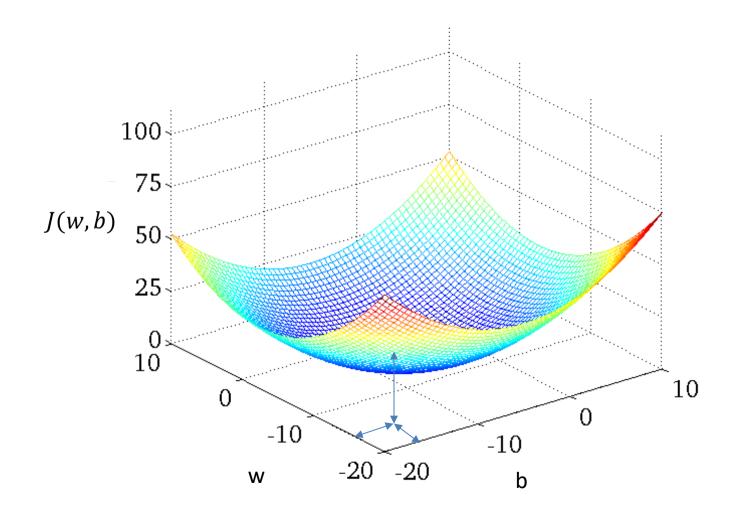

J(w,b)

(function of the parameters w, b)

vv

J(w,b) $f_{w,b}(x)$ (function of the parameters w, b) (function of x (when w and b fixed)) 0.5 700 0.4 600 0.3 500 0.2 Price \$ (in 1000s) 0.1 400 W 0 300 -0.1 -0.2 200 -0.3 100 Training data -0.4 Current hypothesis -0.5 -1000 1000 2000 3000 4000 -500 0 500 1000 1500 2000 Size (feet<sup>2</sup>) b

# Gradient descent

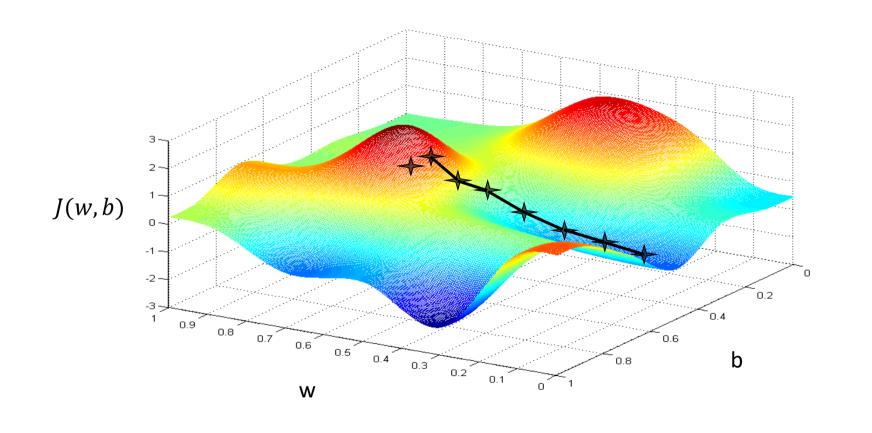

Have some function

Want 
$$\underset{w,b}{\text{minimize}} J(w,b)$$

#### **Outline:**

- Start with some w,b
- Keep changing w, b to reduce J(w, b)
   until we hopefully end up at a minimum

#### **Gradient descent algorithm**

Correct: Simultaneous update

Incorrect:

Gradient descent intuition

#### **Gradient descent algorithm**

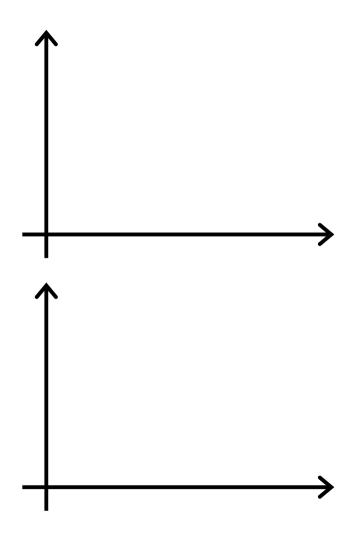

Repeat until convergence

$$temp_{w} = w - \alpha \frac{\partial}{\partial w} J(w, b)$$

$$temp_{b} = b - \alpha \frac{\partial}{\partial b} J(w, b)$$

$$b = temp_{b}$$

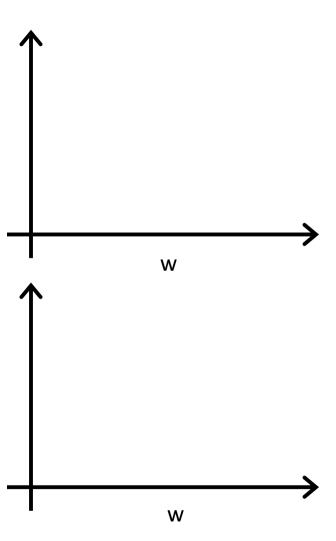

$$w = temp_{w}$$

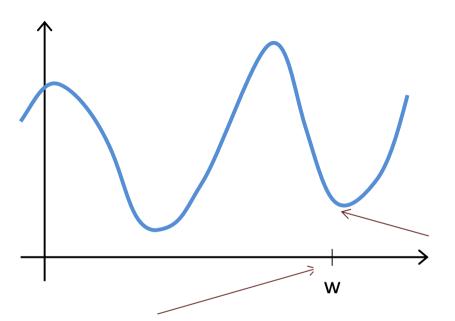

$$w = w - \alpha \frac{\partial}{\partial w} J(w)$$

If  $\alpha$  is too small, gradient descent can be slow.

If  $\alpha$  is too large, gradient descent can overshoot the minimum. It may fail to converge, or even diverge.

w at local optima

Current value of w

$$w = w - \alpha \frac{\partial}{\partial w} J(w)$$

Gradient descent can converge to a local minimum, even with the learning rate  $\alpha$  fixed.

time

As we approach a local 
$$J(\theta_1)$$
 minimum, gradient descent will automatically take smaller steps. So, no need to decrease  $\alpha$  over

Gradient descent for linear regression

#### Repeat until convergence

$$temp_{w} = w - \alpha \frac{\partial}{\partial w} J(w, b)$$
$$temp_{b} = b - \alpha \frac{\partial}{\partial b} J(w, b)$$

$$temp_b = b - \alpha \frac{\partial}{\partial b} J(w, b)$$

$$b = temp\_b$$

$$w = temp_w$$

#### **Linear Regression Model**

$$f_{w,b}(x) = wx + b$$

$$J(w,b) = \frac{1}{2m} \sum_{i=1}^{m} (f_{w,b}(x^{(i)}) - y^{(i)})^2$$

$$\frac{\partial}{\partial w}J(w,b)$$

$$\frac{\partial}{\partial b}J(w,b)$$

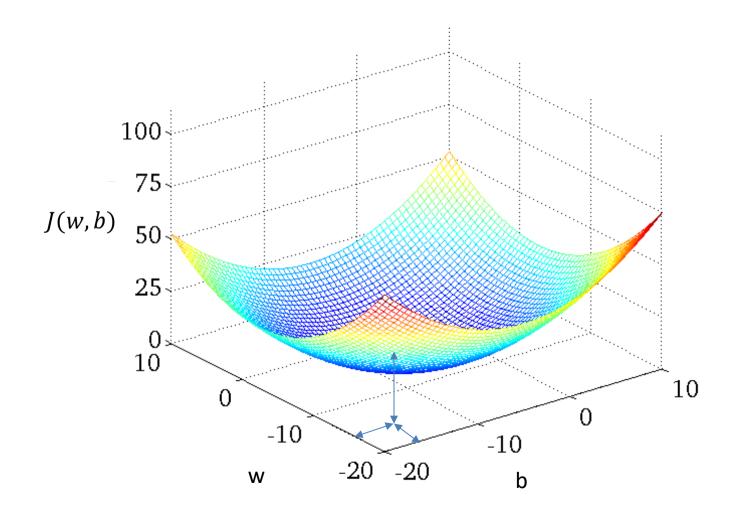

#### **Gradient descent algorithm**

Repeat until convergence

$$temp_w = w - \alpha \frac{\partial}{\partial w} J(w, b)$$

$$temp_b = b - \alpha \frac{\partial}{\partial b} J(w, b) =$$

$$b = temp\_b$$
  
 $w = temp\_w$

#### "Batch" Gradient Descent

"Batch": Each step of gradient descent uses all the training examples.
